

Model Report Help

Use this dialog box to view information about environment variables and to select one of three reports to generate. You can select a report by clicking on its radio button.

The dialog box fields are as follows:

- **Environment Variable field**—At the top of the dialog box, this field contains paths referenced by the environment variables used by the Browser. Use this information to verify that the models are referenced as you intended.
- **Report Selection field**—Following the environment variable field, this field contains three options you can choose for generating a report:
 - Report models found in Configuration files but not in Library—Choose this option if you want to know about any models used by your design that cannot be found in the library installed at your site. This option is selected initially.
 - Report models found in Library but not in Configuration files—Choose this option if you want to know whether any models in the library installed at your site are not listed either in the default configuration file or in your custom configuration files.
 - List all models with their source Configuration files—Choose this option if you want to see a mapping of each model to the configuration file in which the Browser found it. Using this report, along with the contents of the LMC_CONFIG environment variable, you can verify that the file listed first in LMC_CONFIG contains the version of the model you want to use in your design.

Model Report Help

SmartModel Library users who want more information about models in general can refer to the [*SmartModel Library User's Manual*](#).
