

Regenerate Help

Executing the Regenerate command produces the following effects:

- Regenerates the default configuration (LMC) file—All values are set equal to the latest version of each model found. Any update information about models previously added or purged is lost.
- Rebuilds the library cache to provide faster access to the models.
- Resets all library-versioned links to point to the latest version of SWIFT.

The Regenerate command works on one platform at a time; you must run it a separate time for each platform.

SmartModel Library users who want more information about regenerating the library files can refer to the *SmartModel Library Administrator's Manual*. If you are running the Admin tool off the CD-ROM, [click here](#). If you are using the network-installed Admin tool, [click here](#).
