Locate File to Check Help

Use this dialog box to specify a configuration file to be checked against your installed library when generating a library report. By default, the Admin tool uses the configuration file in your $LMC_HOME/data directory, based on your platform.

You can control the following functions when specifying a configuration file:

- **Filter**—file name or file extension to be used when searching for the configuration file.

- **Directories**—list of directories to select when searching for files specified in the Filter field.

- **Files**—list of files that meet criteria in the Filter field.

- **Selection**—path name for the configuration file.

SmartModel Library users who want more information about configuration files can refer to the *SmartModel Library Administrator's Manual.* If you are running the Admin tool off the CD-ROM, click here. If you are using the network-installed Admin tool, click here.
