Model Filters Help

Use this dialog box to specify filter options for displaying a subset of the model library. Select one or more of the four filter options by clicking on the appropriate check box button.

The dialog box fields are as follows:

- **String Search field**—Contains a string that specifies a model name or timing version name to search for; or part of a name plus the wildcard character (*). This field is initially set to display all models or timing versions. By default, this field is selected when the dialog box opens.

- **Vendors list box**—Contains a list of vendors to select as a filter option. Use this field if you want to narrow the display to models of parts from specific vendors.

- **Function/Subfunction list box**—Contains a list of functions and subfunctions to select as filter options. Use this field if you want to narrow the display to models that have specific functions.

- **Licensed Packages list box**—Contains a list of licensed packages to select as filter options. Use this field if you want to narrow the display to models contained in one or more specific licensed packages, or if you want to know whether a specific model is contained in a particular licensed package.

- **Summary of Filter Options field**—Displays the filter options currently selected.

Model Filters Help

To filter a model list, follow these steps:

1. Click on the check box for each desired option.

2. For each option you checked, select one or more items from its list box. Use the scroll bar to traverse the list. To select more than one item, hold down the Ctrl key as you click on each item. To specify a model or timing-version to search for, type the complete name of the model or timing-version, or a partial name with the wildcard character (*) in the String Search text field in each position where you have omitted characters. The name you typed appears in the "Summary of Filter Options" list box. If you select multiple items, they appear OR'ed together.

3. When you have finished selecting filter options, click on the Filter or OK button.

4. Click on the Close button to dismiss the dialog box. The list box in the transcript window displays a list of models and timing versions that meet the filtering criteria. The status pane displays the number of models and timing-versions found.

SmartModel Library users who want more information about using the Admin tool can refer to the *SmartModel Library Administrator's Manual*. If you are running the Admin tool off the CD-ROM, click here. If you are using the network-installed Admin tool, click here.
