Copy Customizable Files Help

Use this dialog box to copy a model's timing file (or other customizable file) to your directory for customization.

To copy a customizable file, follow these steps:

1. From the selection pane, select the model or timing version whose timing file or other customizable file you want to copy.

2. From the Actions menu, choose Copy Customizable Files. The Copy Customizable Files dialog box opens. At a minimum, the Timing Source File option appears, with its check box selected. If other customizable files are available for that model, they also appear in the dialog box.

3. If the file you want to customize is not already selected, click on its check box.

4. In the To Destination Directory text field, type the path name of the directory where you want the file to be copied.

5. Click on the Copy button.

SmartModel Library users who want more information about creating custom timing files can refer to the *SmartModel Library User's Manual*.
